Dear Sir

Rocklands Group Copper Project – Native Copper Assays

The Company has received assays for the copper content in Native Copper from Diamond Drill Core at Rocklands. The samples were recently sent to S.G.S. Laboratories for assaying using Titration technique.

The following results were received:

Sample	Intersection	Copper Metal Content
1.	54-55m	99.67% Cu
2.	58-59m	99.53% Cu
3.	72-73m	99.83% Cu
4.	81-82m	<u>99.57% Cu</u>

Average Grade Cu 99.65% Cu

The samples assayed are the result of drill intersections of diamond core from drill hole LMDH007. The results are from individual composites of the native copper over LMDH007 intersections 54-55m, 58,59m, 72-73m and 81-82m.

.../2

The assaying of the native copper is to provide metallurgical data for the feasibility study currently underway. The assays of the 1m intersections of the average copper grade (not copper metal grade) for LMDH007 were reported to the ASX on 20 June 2007.

Yours faithfully

Peter Hutchison
Executive Director
